

Strings

```
x='Single Quote-Example'
print(x)
y="Double Quote-Example"
print(y)
z="Single quote ' in between double quotes"
print(z)
p='Double quote " in between single quote'
print(p)
```

Output

```
[1] "Single Quote-Example"
[1] "Double Quote-Example"
[1] "Single quote ' in between double quotes"
[1] "Double quote \" in between single quote"
```

To find the length of a String in R, use nchar() function

To find length of string

```
x = 'Hello Everyone!'
```

find length using nchar(c)

```
length = nchar(x)
```

```
print (length)
```

```
[1] 15
```

Example to find length of a number in R

to find length of number

```
x = 1234567
```

find length using nchar(c)

```
length = nchar(x)
```

```
print (length)
```

```
[1] 7
```

To concatenate strings in r programming, use paste()

Example R program to concatenate two strings

```
x = 'Hello'
```

```
y = 'Everyone!'
```

concatenate two strings using paste function

```
z = paste(x,y)
```

```
print (z)
```

```
[1] "Hello Everyone!"
```

Example: Concatenate Strings in R with no separator

```
x = 'Hello'
```

```
y = 'World!'
```

concatenate two strings using paste function

```
z = paste(x,y,sep="")
```

```
print (z)
```

```
[1] "HelloWorld!"
```

Concatenate Multiple Strings

In this example, we shall use paste() function with the separator as hyphen, i.e., sep="-"

```
s1 = 'Hello'
s2 = 'Everyone!'
s3 = 'Learn'
s4 = 'R Programming!'
# concatenate two strings using paste function
res = paste(s1,s2,s3,s4,sep="-")
print (res)
[1] "Hello-Everyone!-Learn-R Programming!"
```

to extract Substring from a String

Example R program to find substring

```
s = 'Hello everyone! Welcome to learn R programming language'
```

```
#substring(c, first, last)
```

```
subStr = substring(s, 17, 34)
```

```
print (subStr)
```

```
output:"Welcome to learn R"
```

Example R program to find substring

```
s = 'Hello everyone! Welcome to learn R programming language'
```

```
#substring(c, first, last)
```

```
subStr = substring(s, 17)
```

```
print (subStr)
```

```
[1] "Welcome to learn R programming language"
```

The string characters can be converted to upper or lower case

R program to Convert case of a string

```
str<- "Hello EveRYoNe LEARN R"
```

```
print(toupper(str))
```

```
print(tolower(str))
```

```
print(casefold(str, upper = FALSE))
```

```
[1] "HELLO EVERYONE LEARN R"
```

```
[1] "hello everyone learn r"
```

```
[1] "hello everyone learn r"
```

R program to Convert case of a string

```
str<- "Hello EveRYoNe LEARN R"
```

```
print(toupper(str))
```

```
print(tolower(str))
```

```
print(casefold(str, upper = TRUE))
```

```
"HELLO EVERYONE LEARN R"
```

```
[1] "hello everyone learn r"
```

```
[1] "HELLO EVERYONE LEARN R"
```
